# 1 Introduction

The **Konecta ERP System** is a full-stack enterprise web application designed to integrate **HR** and **Finance** functions within a unified and secure platform. It automates workflows, enhances collaboration, and provides real-time analytics to management. The system is built using a microservices architecture, ensuring modularity, scalability, and independent service deployment.

## 1.1 System Objectives

- Automate HR and Finance workflows for efficiency and transparency.
- Enable employees to self-manage attendance, leaves, and payroll.
- Provide real-time dashboards and reports to HR and Finance managers.
- Ensure data integrity, security, and scalability using cloud deployment.

## 1.2 Core Modules

1. **Auth Service:** Handles JWT-based authentication and secure access.
2. **HR Service:** Manages recruitment, attendance, leaves, training, performance, and offboarding.
3. **Finance Service:** Manages payroll, expenses, invoices, and financial reports.
4. **Reporting Service:** Built using ASP.NET; generates analytics dashboards, exportable PDF/Excel reports, and cross-module summaries.
5. **Admin Portal:** Provides centralized control, analytics, and user management.
6. **Employee Portal:** Enables employees to view and manage their own data.

# 2 System Architecture Overview

The ERP system follows a **microservices-based architecture** with independent backend services connected through REST APIs.

## 2.1 Architecture Components

- **Frontend:** Angular web application (HR, Finance, Admin, and Employee dashboards)
- **Backend:** Spring Boot microservices (Auth, HR, Finance)
- **Reporting Service:** ASP.NET Core microservice integrated via REST APIs for generating and exporting reports.
- **Database:** PostgreSQL (separate schema per service)
- **API Gateway:** Spring Cloud Gateway for routing and centralized access
- **Service Discovery:** Eureka Server for dynamic service registration
- **Configuration Management:** Spring Cloud Config Server
- **Security:** JWT authentication with role validation
- **Deployment:** Docker containers and CI/CD pipeline integration

## 2.3 Database Architecture Overview

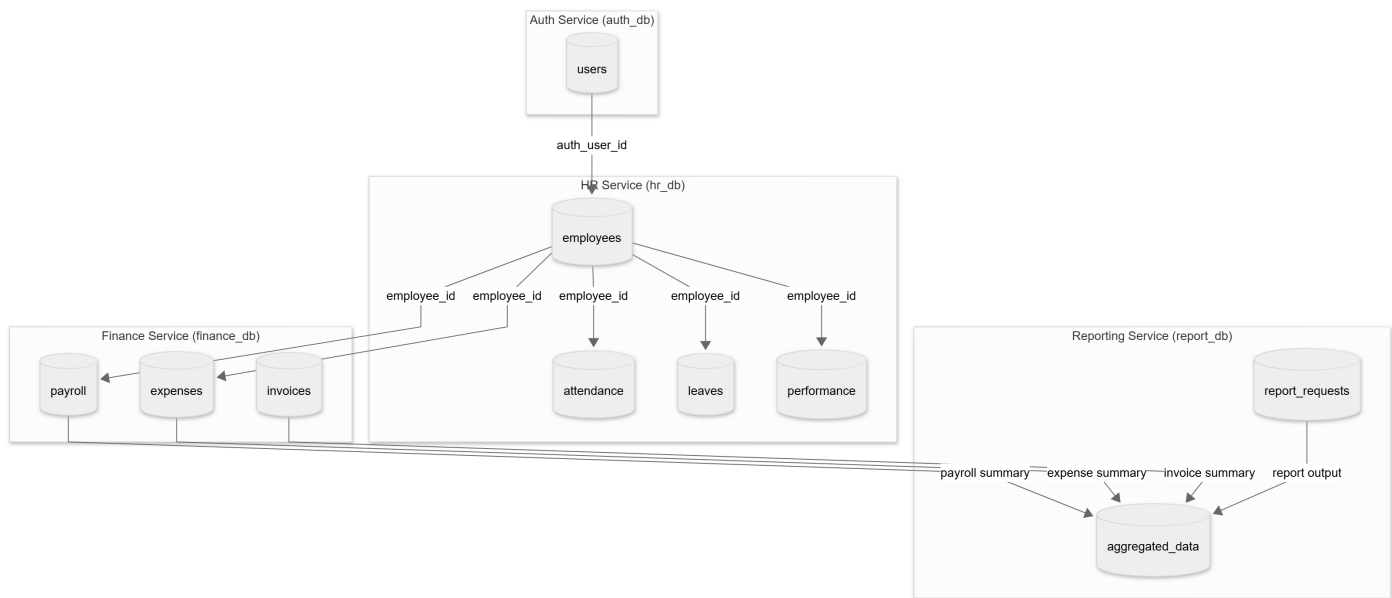

Figure 3: High-level Database Architecture

## 2.4 Detailed Database Schema (ERD)

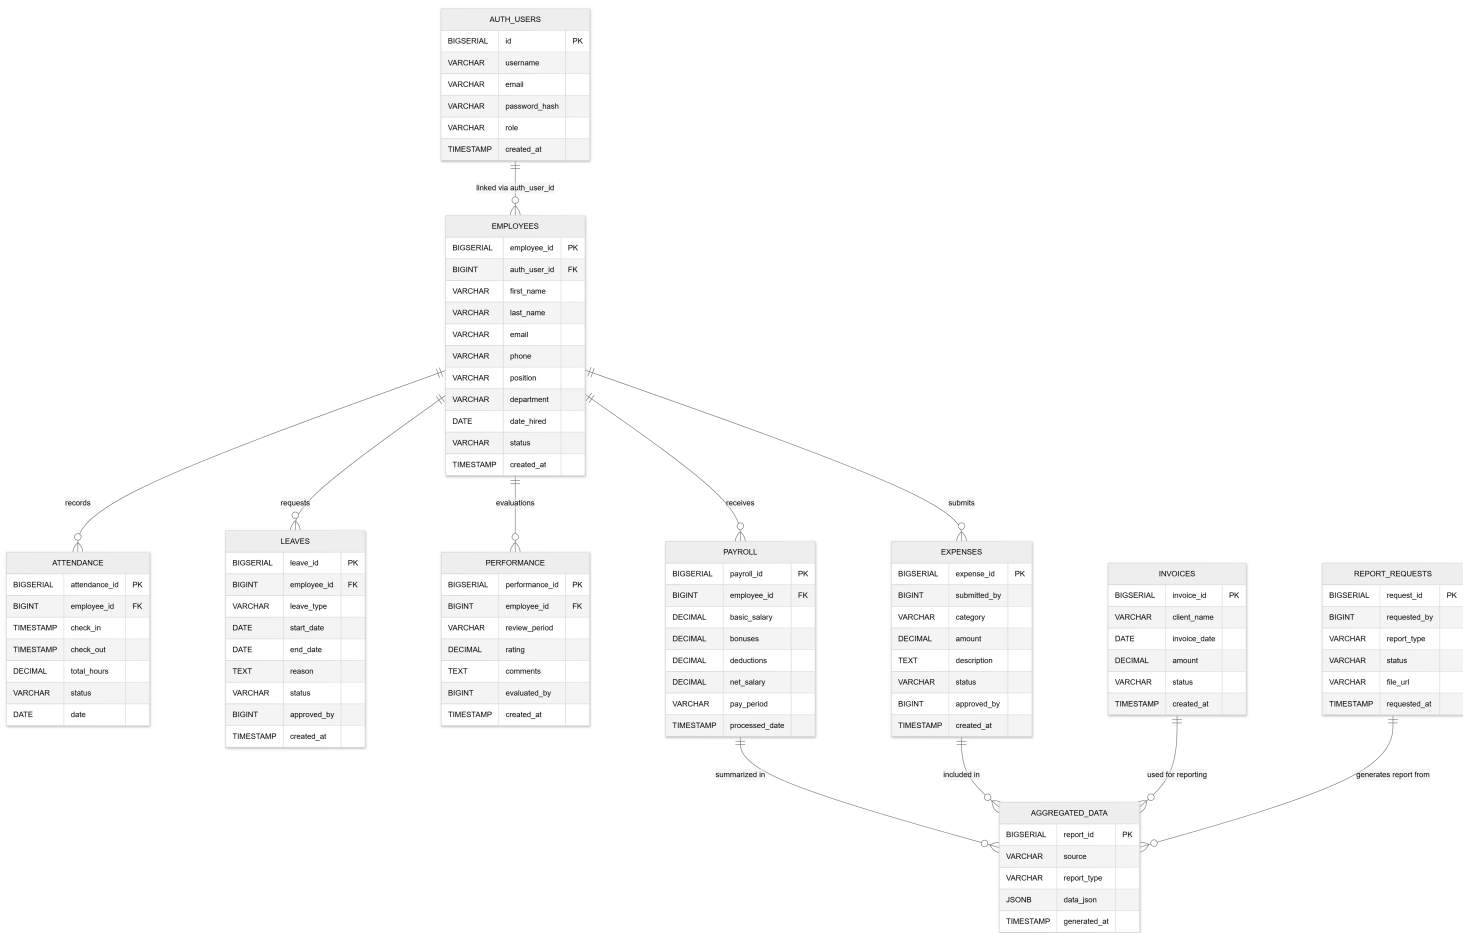

Figure 4: Low-level Database Schema ERD

### 3 HR Module Architecture

The **HR Service** automates the complete employee lifecycle, from recruitment to offboarding. It integrates attendance, training, and performance management for a seamless workflow.

Figure 5: HR-mindmap

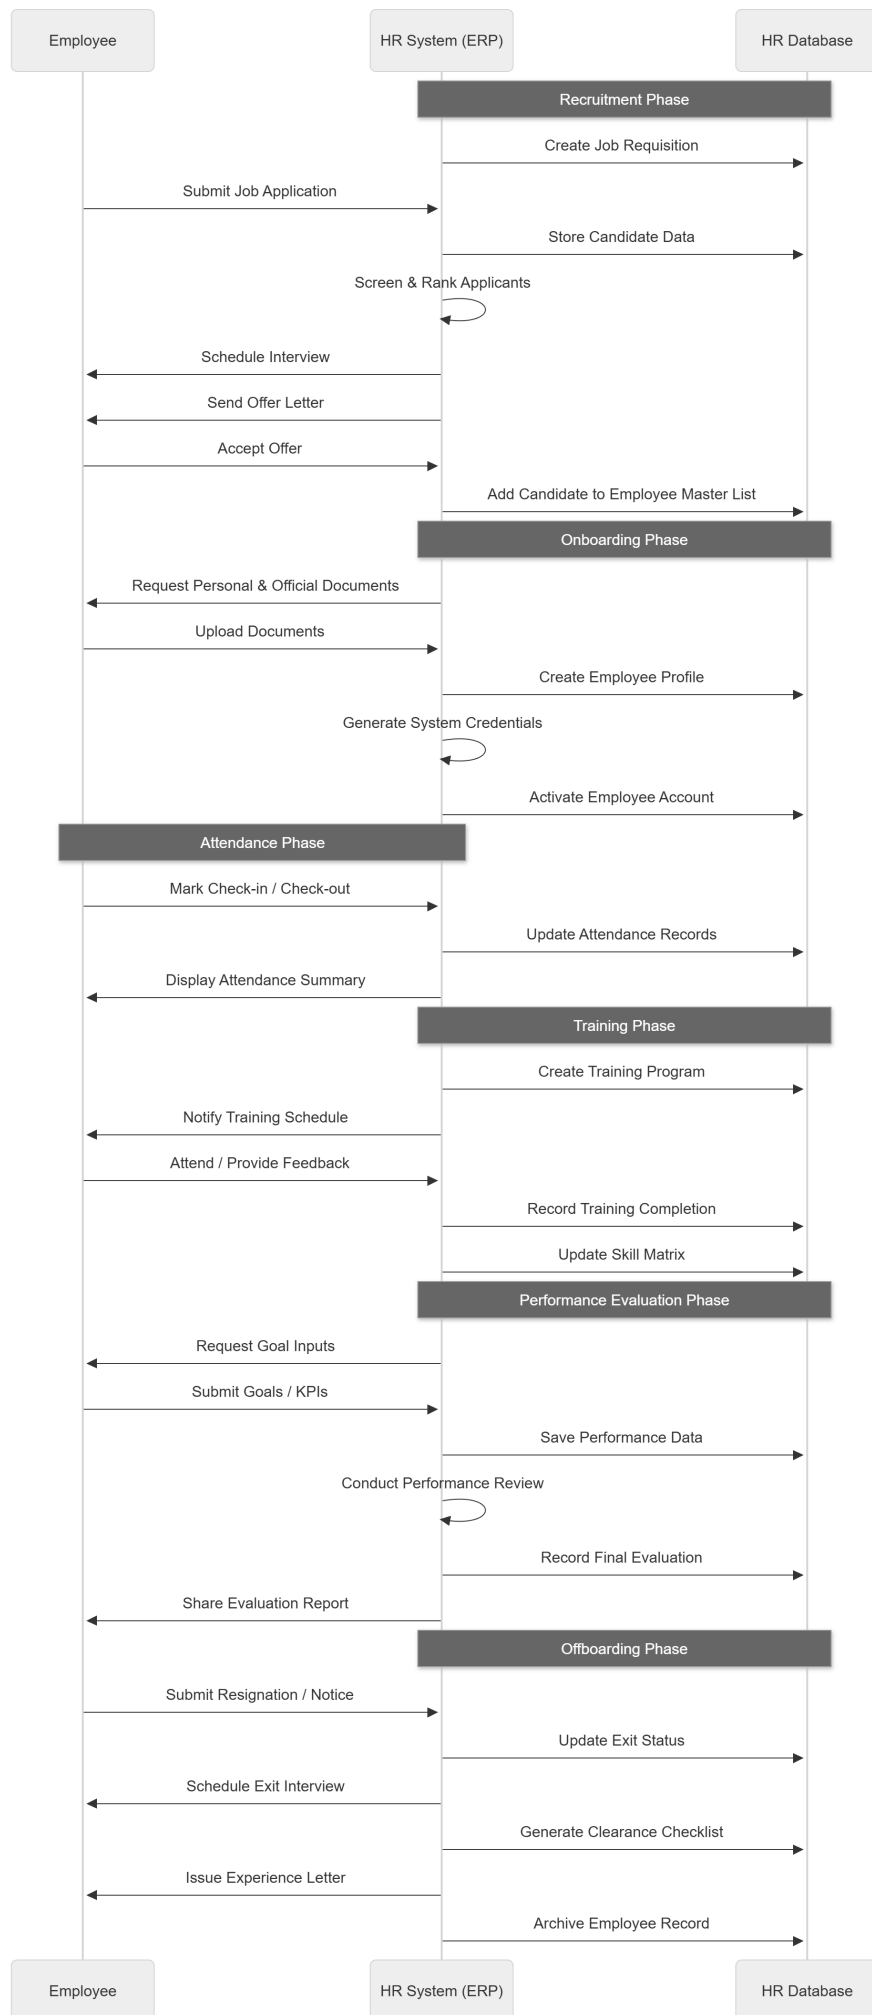

Figure 6: HR Sequence Diagram

Table 1: HR Sub-Modules Overview

| Sub-Module             | Description   | ERP Output                                     |
|------------------------|---|--|
| Recruitment            | Job requisition, posting, screening, interviews, and offers   | Hired candidates added to employee master list |
| Onboarding             | Employee profile creation, credential setup, document upload  | Active employee account with full access       |
| Attendance             | Check-in/out tracking, absence records, over-time calculation | Real-time attendance logs synced to payroll    |
| Training               | Program scheduling, nominations, feedback, certification      | Updated skill matrix and learning record       |
| Performance Evaluation | Goal setting, reviews, and scoring                            | Performance data linked to payroll module      |
| Offboarding            | Exit interviews, clearance, document generation               | Securely archived employee record              |

## 4 Finance Module Architecture

The **Finance Service** manages all financial operations including payroll, expenses, and financial reporting.

Table 2: Finance Sub-Modules Overview

| Sub-Module         | Description  |
|--------------------|--|
| Payroll Management | Automatically calculates salaries using attendance and performance data.       |
| Expense Management | Records and tracks organizational and departmental expenses.                   |
| Invoicing          | Handles client and vendor billing with automated report generation.            |
| Financial Reports  | Provides dashboards and summaries of budgets, expenditures, and profitability. |

## ANNUAL BUDGETING PROCESS WORKFLOW

Figure 10: Annual Budgeting process workflow

## 5 Reporting Service Architecture

The **Reporting Service** is an independent ASP.NET Core microservice responsible for analytics visualization, PDF/Excel report generation, and consolidated ERP data summaries. It integrates with both the HR and Finance microservices through REST APIs.

- **Technology Stack:** ASP.NET Core 8.0, C#, Entity Framework, SQL Server (or PostgreSQL), and RESTful APIs.
- **Integration:** Consumes endpoints from HR and Finance services to compile data for dashboards and exports.
- **Output Formats:** Interactive dashboards, downloadable PDF reports, and Excel summaries.
- **Access Control:** Only Admins and Managers can generate organization-wide reports; HR and Finance users can generate module-specific reports.

Table 3: Reporting Sub-Modules Overview

| Sub-Module          | Description   |
|---------------------|---|
| Data Aggregation    | Fetches data from HR and Finance microservices for consolidated analysis.   |
| Report Generation   | Creates PDF/Excel reports for payroll, attendance, and financial summaries. |
| Dashboard Analytics | Displays performance indicators, expense trends, and productivity charts.   |
| Export and Sharing  | Allows exporting reports and sharing with Admin/HR/Finance departments.     |

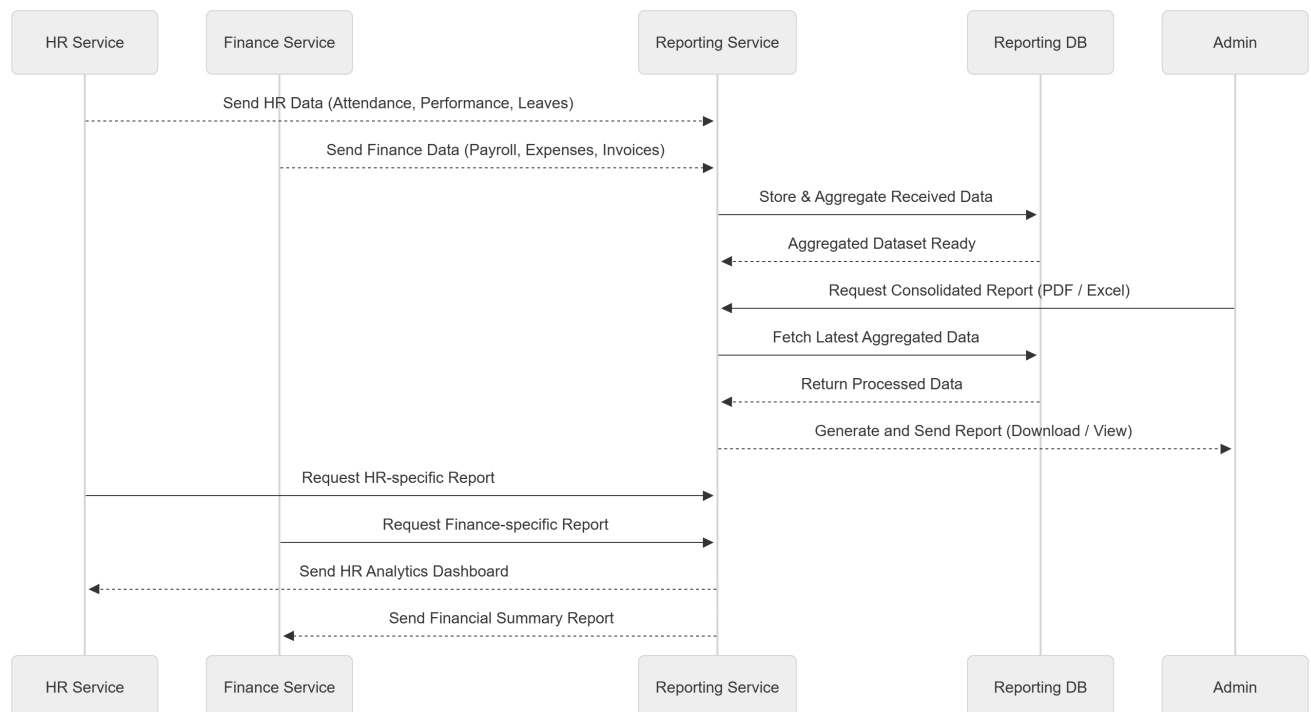

Figure 11: Report Sequence Diagram

## 6 Functional Requirements

This section defines the functional capabilities that the Konecta ERP System must provide. Each requirement describes the expected behavior of a specific module or user interaction within the system.

### 6.1 Overview

The ERP system supports multiple roles — **Admin**, **HR**, **Finance**, and **Employee**. Each role has a distinct set of features aligned with its operational responsibilities.

### 6.2 Functional Requirements Table

| ID    | Requirement Description   | Priority | Module      |
|-------|---|----------|-------------|
| FR-1  | The system shall allow users to log in using username/email and password.   | High     | Auth        |
| FR-2  | The system shall verify credentials and issue a JWT token upon successful authentication.                           | High     | Auth        |
| FR-3  | The system shall allow the Admin to manage users (add, update, delete, and assign roles).                           | High     | Admin       |
| FR-4  | The HR module shall allow HR staff to register new employees and maintain employee records.                         | High     | HR          |
| FR-5  | The HR module shall allow employees to mark daily attendance and track working hours.                               | High     | HR          |
| FR-6  | The HR module shall allow employees to submit leave requests and HR to approve or reject them.                      | High     | HR          |
| FR-7  | The HR module shall allow HR to evaluate employee performance and record ratings and feedback.                      | Medium   | HR          |
| FR-8  | The Finance module shall automatically calculate payroll based on attendance, performance, and deductions.          | High     | Finance     |
| FR-9  | The Finance module shall allow Finance staff to process expenses, including submission, review, and approval.       | High     | Finance     |
| FR-10 | The Finance module shall handle client and vendor invoicing and track payment statuses.                             | Medium   | Finance     |
| FR-11 | The Reporting module shall aggregate data from HR and Finance to generate analytical dashboards.                    | High     | Reporting   |
| FR-12 | The Reporting module shall generate exportable reports in PDF and Excel formats.                                    | Medium   | Reporting   |
| FR-13 | The system shall restrict access to data and APIs based on JWT roles (Admin, HR, Finance, Employee).                | High     | Security    |
| FR-14 | The system shall allow the Admin to view overall analytics and monitor module activity.                             | Medium   | Admin       |
| FR-15 | The Employee portal shall display personal information, attendance, salary, and performance data.                   | High     | Employee    |
| FR-16 | The system shall allow the Finance and HR modules to communicate securely with the Reporting service via REST APIs. | High     | Integration |

|       |   |        |           |
|-------|---|--------|-----------|
| FR-17 | The system shall log all critical operations (logins, approvals, and updates) for audit purposes. | Medium | Security  |
| FR-18 | The system shall provide error messages and validation feedback for all input fields.             | Medium | General   |
| FR-19 | The system shall support data export for payroll summaries and employee attendance.               | Medium | Reporting |
| FR-20 | The system shall provide dashboards summarizing HR, Finance, and overall business KPIs.           | High   | Reporting |

### 6.3 Functional Requirement Categories

- **Authentication and Access Control:** Secure login, token generation, and role validation.
- **Human Resources Management:** Employee data management, attendance, leave, and performance tracking.
- **Finance Management:** Payroll processing, expense tracking, and invoicing.
- **Reporting and Analytics:** Real-time dashboards, performance insights, and exportable reports.
- **Administration:** User management, monitoring, and global configuration.

## 7 Test Cases for Functional Requirements

This section describes the test cases that validate each functional requirement of the Konecta ERP System. Each test case specifies the input, expected output, and success criteria to ensure the requirement functions as intended.

| FR ID | Test Case Description  | Test Input                         | Expected Output  |
|-------|--|------------------------------------|--|
| FR-1  | Verify user login with valid credentials.                              | Username and password.             | User is successfully logged in and redirected to dashboard.              |
| FR-2  | Validate JWT token is generated upon successful login.                 | Valid credentials.                 | JWT token issued and stored in frontend securely.                        |
| FR-3  | Test Admin user management functions (add, edit, delete, assign role). | Admin account and user details.    | New user created/updated/deleted successfully and reflected in Auth DB.  |
| FR-4  | Verify HR can register new employees.                                  | HR inputs employee data.           | New employee record appears in employee list and HR DB.                  |
| FR-5  | Verify attendance marking and logging.                                 | Employee clicks “Mark Attendance”. | Attendance record created with timestamp and status “Present”.           |
| FR-6  | Test leave request submission and HR approval/rejection.               | Employee submits leave form.       | Leave status changes to “Pending” → “Approved/Rejected” after HR action. |

|       |  |                                       |  |
|-------|--|---------------------------------------|--|
| FR-7  | Verify HR can record employee performance evaluation.                      | HR enters rating and feedback.        | Performance record saved and visible in employee profile.                |
| FR-8  | Test automatic payroll generation using attendance and performance data.   | Payroll period input.                 | Net salary calculated and stored in payroll table.                       |
| FR-9  | Validate expense management workflow.                                      | Employee submits expense claim.       | Expense recorded, pending for approval, status updates correctly.        |
| FR-10 | Verify invoicing and payment status tracking.                              | Finance creates new invoice.          | Invoice generated, saved in database, and status updated (Paid/Unpaid).  |
| FR-11 | Test report aggregation from HR and Finance services.                      | Request analytics report.             | Data successfully fetched from both services and displayed in dashboard. |
| FR-12 | Validate PDF/Excel report export function.                                 | Admin clicks “Export Report”.         | File successfully generated and downloaded.                              |
| FR-13 | Verify access control for each role (Admin, HR, Finance, Employee).        | Login using each role.                | Restricted modules accessible only to authorized roles.                  |
| FR-14 | Check Admin dashboard monitoring and analytics.                            | Admin login.                          | Dashboard displays live KPIs and user activity logs.                     |
| FR-15 | Test employee self-service features.                                       | Employee login.                       | Employee views personal attendance, salary, and performance data.        |
| FR-16 | Validate secure communication between HR, Finance, and Reporting services. | API call between services.            | Encrypted REST response received with valid JWT verification.            |
| FR-17 | Test system logging for major operations.                                  | Perform create/update/delete actions. | Log entry stored in system log file or DB with timestamp.                |
| FR-18 | Check form input validation and error handling.                            | Submit form with invalid fields.      | Proper error message displayed (e.g., “Invalid Email”).                  |
| FR-19 | Test data export for payroll summaries and attendance logs.                | Admin clicks export button.           | CSV/XLS file generated containing requested data.                        |
| FR-20 | Verify dashboard KPIs for HR, Finance, and overall performance.            | Open analytics dashboard.             | Metrics displayed correctly with up-to-date data.                        |

## 7.1 Test Execution Notes

- All test cases should be executed on the staging environment before production deployment.
- JWT tokens must be validated in every API call to ensure secure communication.
- Testing tools such as **Postman** and **JUnit** are recommended for backend verification.
- **Manual UI testing** should be performed for dashboard features and form validation.

- Test results must be documented with “Pass” or “Fail” outcomes and attached screenshots when applicable.

## 8 Security Architecture

Table 6: Security Layers and Features

| Security Component  | Description   |
|---------------------|---|
| Authentication      | JWT token-based authentication using Spring Security. |
| Authorization       | Role validation for Admin, HR, Finance, and Employee. |
| Encryption          | Data encrypted in transit (SSL/TLS) and at rest.      |
| Password Protection | All user passwords hashed using BCrypt.               |
| Incident Response   | Logging, alerting, and monitoring of security events. |
| Compliance          | GDPR-like data access and retention policies.         |

## 9 Role Policies and User Flows (JWT-based)

This ERP system implements authentication using **JSON Web Tokens (JWT)**. Each user logs in and receives a signed token that identifies their role (**ADMIN**, **HR**, **FINANCE**, or **EMPLOYEE**). Spring Security annotations such as `@PreAuthorize("hasRole('HR')")` enforce what each user can access at the API level.

### 9.1 Role Access Summary

Table 7: Role Access Policies

| Role     | What They Can See   | What They Can Do   | Example APIs  |
|----------|---|--|---|
| Admin    | All dashboards (HR + Finance + Employee data)               | Manage users, approve HR/Finance actions, and access all reports | <code>/api/auth/*</code> , <code>/api/hr/*</code> , <code>/api/finance/*</code>   |
| HR       | Employee records, attendance, leaves, and performance       | Add/update employees, approve/reject leaves, record performance  | <code>/api/hr/employees</code> , <code>/api/hr/attendance</code> , <code>/api/hr/leaves</code> , <code>/api/hr/performance</code> |
| Finance  | Payroll, expenses, and invoices                             | Process payroll, manage expenses, generate financial reports     | <code>/api/finance/payroll</code> , <code>/api/finance/expenses</code> , <code>/api/finance/invoices</code>                       |
| Employee | Personal dashboard (attendance, leave, salary, performance) | Mark attendance, request leave, view salary, and performance     | <code>/api/hr/attendance</code> , <code>/api/hr/leaves</code> , <code>/api/finance/payroll/{id}</code>                            |

### 9.2 Access Control Policy Table

Table 8: API Access Control Summary

| API Prefix             | Accessible By      | Description                        |
|------------------------|--------------------|------------------------------------|
| /api/auth/*            | Admin              | User and authentication management |
| /api/hr/employees*     | HR, Admin          | Employee CRUD operations           |
| /api/hr/attendance*    | HR, Employee       | Attendance management              |
| /api/hr/leaves*        | HR, Employee       | Leave requests and approvals       |
| /api/hr/performance*   | HR, Admin          | Performance evaluations            |
| /api/finance/payroll*  | Finance, Admin     | Payroll processing                 |
| /api/finance/expenses* | Finance            | Expense management                 |
| /api/finance/invoices* | Finance            | Invoice management                 |
| /api/reports/*         | Admin, HR, Finance | Reporting endpoints                |

### 9.3 JWT Security Flow

1. User sends login credentials to /api/auth/login.
2. Authentication Service validates credentials and returns a JWT token.
3. The frontend stores the token securely (e.g., localStorage).
4. Each request includes the token in the **Authorization** header.
5. The API Gateway verifies the token before routing.
6. The backend checks user role claims using Spring Security.
7. Access is granted or denied based on token claims.

## 10 Technologies Used

Table 9: Technology Stack

| Layer                    | Technology                             |
|--------------------------|--|
| Frontend                 | Angular 18, TypeScript                 |
| Backend                  | Spring Boot 3.5.6, Java 21             |
| Reporting Service        | ASP.NET Core 8.0, C#, Entity Framework |
| Database                 | PostgreSQL                             |
| Security                 | Spring Security, JWT                   |
| API Gateway              | Spring Cloud Gateway                   |
| Service Discovery        | Eureka Server                          |
| Configuration Management | Spring Cloud Config                    |
| Deployment               | Docker, Jenkins (CI/CD)                |
